

Cosmi Code Summer Internship Program

Week 5- Task # 01

Task 1: List and explain 5 key blogging performance metrics (views, bounce rate, average time on page, etc.).

Submitted by Xenobia Mustafa Khan

Intern ID: CCP\345670084

Submission Date: 02nd August 2025, Saturday

Task 1: List and explain 5 key blogging performance metrics (views, bounce rate, average time on page, etc.).

1) Bounce Rates

- This metric measures how many visitors leave your blog without checking another page of your site. In other words, how frequently visitors leave your blogs without visiting other pages on your blog. If visitors are leaving your blog for a completely different website, you will want to take some measures to increase your content's quality.

2) Time on Page

- This metric measures how long a user stays to engage with your content once they arrive on your page. This metric is a good indicator of how engaging your content is to your blog visitors. The idea behind this is that the longer the visitor stays, the more time they take to read the information rather than skimming around and bouncing away.

3) Organic Clicks/ Organic Click-Through-Rate

- Also known as Organic CTR, this measures the percentage of the searchers that click on a search engine result, which leads to your blog. Again, the idea behind this is that the more organic clicks your content earns, the more traffic your blog receives.

4) Inbound Links

- This metric shows you how effectively your blog is contributing to your website's overall search engine optimization (SEO). This metric refers to the links that your blog earns from other sites. This can help you generate blog traffic from the referring website and expose you to brand new audiences.

5) Social Shares

- When social media users broadcast web content on a social network to their connections, groups, or specific individuals. In simple words, this metric refers to the sharing of your website content across social media platforms. The more people share your content, the more you inform the social media algorithms that your content resonates with other users- and the more the platform promotes it.
